Toolbars that contain malicious code often have the ability to download viruses and malware. The Symantec Connect Technology for Enterprise deployment manager. The invention relates to a touch screen apparatus comprising a screen plate having a first, a second and a third surface, a first light source emitting light towards the first surface of the screen plate, a second light source emitting light towards the second surface of the screen plate, and a third light source emitting light towards the third surface of the screen plate, the first and second light source being disposed on opposite sides of the screen plate. The invention further relates to a method of detecting a touch event on a screen plate of a touch screen apparatus. This invention relates to a touch screen apparatus. Touch screens are used as input devices in electronic devices like mobile phones, personal computers and pagers. Common touch screens are passive touch screens in which light emitted by a first light source is reflected from the screen and a touch is detected by the amount of light reflected from the screen. In addition, active touch screens, based on so-called resistive sensors, are known. These sensors are arranged in a pattern on a first surface of a screen and a finger touches the sensor resulting in a change in the electrical resistance of the sensor. The touch is detected by a connected electronic circuit. These known touch screens are disadvantageous in that they are either not sufficiently reliable, because they are susceptible to interference, or that the response is slow. Furthermore, a change in the conductivity of the medium, in which the sensors are embedded, may cause a change in the electrical resistance of the sensors. Consequently, known touch screens are not able to detect a touch or a gesture at a particular location on the screen without interference. Q: How to use DTO and Repository pattern for Db operations How to use DTO and Repository pattern for Db operations? I don't have a clue about where to start. I have tried with this. A: Basic idea is DTO is for receiving data from client and passing it to next component. Generally DTO is an object with no/little logic and it might be just POJO, but DTO can be any class that includes only necessary data. For example: you have a component that accepts DTO as a parameter to load data into some lists, this means it doesn't really care how that data comes to it, be that from database or some object provided by user. your DAO takes 82157476af
